

JOMAR L. RANGASAJO (BSChE-1B) PORTFOLIO 1: LIST INPUT/EXPRESSIONS THERMAL ENERGY CALCULATOR

In many chemistry laboratory activities, measuring the flow of heat into or out of a system is important for understanding chemical reactions. Because these calculations require multiple variables like mass, specific heat capacity, and temperature change, an automatic calculator becomes a necessary tool for reducing human error.

```
In [4]: Nameofprocessorsolute=input('Name of Process or Solute:')
m=input('Mass of solution (in grams):')
c=input('Specifc Heat Capacity of the Solution (J/g°C):')
t1=input('Initial Temperature (°C):')
t2=input('Final Temperature (°C):')
t=float(t2)-float(t1)
print('Change in Temperature:', float(t))
q=float(m)*float(c)*float(t)
print('The amount of heat energy transferred (J) is:', float(q))
```

Change in Temperature: 10.0

The amount of heat energy transferred (J) is: 4184.0
